Technical Assignment

I used the useState to get the data from the user and axios to grab the data from the json file.
Then the API from openweathermap to get the current weather and also the 5 days forecast.
With JS I've made a search area for the city so when the user search for a city,axios retrieving the data from API and then placing them from json to the main block of code,with different's container's on a main container to display each different clue to the specific container block.
At the end on css file I've gave appearance to the containers,to the search box and to the background.

At the end on my project i only could display the current weather and I couldn't retrieve the data for every three hours for the next five days.I've tried to make an other container placed at the bottom to display those data but without any result.

Thanks in advance!
